**PREMIUM DRAINAGE WRAP**

Barricade® Wrap Plus Drainage’s unique non-directional surface pattern creates a standoff property that facilitates water drainage on the material. Barricade® Wrap Plus Drainage provides a drainage path for water to flow freely as it is channeled safely down and away from the envelope — it’s the home’s rain coat and windbreaker in one!

**WHY YOU NEED IT**

Perfectly Designed For Stucco, Stone Veneer, and EIFS
When a primary layer of felt paper or paper backed wire lath is properly installed over the surface of Barricade® Wrap Plus Drainage, a “bond break” is created and thus dramatically improves and enhances the drainage properties of the stucco system.

**Breathable membrane**
If moisture gets trapped in the walls, it can destroy the integrity of your insulation. Our unique, micro-porous, “breathable” membrane allows moisture vapor to pass through without becoming trapped in the wall cavity to provide the utmost in air and moisture control.

**Surfactant resistant**
Not affected by pressure washing, job-site chemicals, or sugars from tree sap and wood sidings, unlike some other products.

**Designed translucence**
Barricade Wrap Plus Drainage can be installed right over the sheathing, and because you can see through it, framing members are easy to find.

**Compliant with IRC and IBC as an air barrier**

---

**Resists bulk water**
Resists water penetration from wind-driven rain and other sources. The WRB coating is on the exterior drainage plane for maximum protection.

**Superior wind and tear resistance**
Heavy winds pose a threat to house wrap during installation. With its tear-resistant design, Barricade Wrap Plus Drainage is highly durable.

**Stops solar vapor drive**
Limits incoming moisture while allowing unwanted moisture to escape the wall cavity. This prevents the moisture from inward solar vapor drive from damaging the wall cavity.

**UV resistance**
Barricade’s special ultraviolet stabilizers protect it from the sun’s harsh rays. In fact, Barricade Wrap Plus Drainage is protected against UV rays for up to 9 months.
THE DRAINAGE PLANE STRATEGY

All types of exterior wall finishes allow some amount of water to pass through. The drainage plane is a layer of weather-resistive material that covers the home’s exterior and integrates with flashing to provide a drainage path from the roof to the ground. Without a drainage plane, wall assemblies can retain water, contributing to mildew, mold growth, and eventual structural failure.

Creating an airspace is the key factor to superior drainage plane performance

Barricade® Wrap Plus Drainage creates a non-directional drainage path by maintaining an airspace between the sheathing and exterior cladding, allowing water to drain down and out.

Conventional smooth surface house wraps with typical horizontal lap siding directly applied can “pond” water along the siding edges, particularly at the pressure points where it is fastened tightly to the sheathing substrate.

Barricade® Wrap Plus Drainage prevents ponding because of its engineered surface pattern which enables water to drain freely between the house wrap surface and exterior cladding, rather than pooling against the wall cavity.

Warranty
Barricade® Wrap Plus Drainage is backed by a 10-year limited system warranty.
